Champs de recherche:

My group concentrates on neural dynamics with particular emphasis on sensorimotor integration and memory systems. We combine optical imaging (e.g., two-photon imaging), optogenetics, electrophysiology, behavioural methods and computational tools to investigate how different brain areas communicate with one another to (a) encode and consolidate memory or (b) generate motor movement based on sensory inputs. We also have an interest in structure-function relationships in the brain. The lab has expertise in optics, engineering and microscopy that allows us to develop/employ hardware tools to collect brain activity/behaviour at multiple scales. Our expertise in computational neuroscience techniques allows us to develop quantitative tools (including artificial intelligence and machine learning approaches) to understand brain dynamics and behaviour in health and brain disease.

Entrée libre

La conférence sera présentée en anglais
